Live · Secure · Scalable · Profitable

Problem and resolution

The everyday risks of running a SaaS portfolio, and how SaaS Sentinel deals with each one.

Building an app with Lovable and Supabase is fast. Keeping a portfolio of them live, secure, scalable and profitable is where the work starts. SaaS Sentinel watches every app in one place, every 15 minutes, so problems are found by you rather than your customers.

14 days	15 min	£18/mo	4 pillars
free trial, no card	checks, every app	Starter, 5 projects	live, secure, scalable, profitable

THE PROBLEM		HOW SAAS SENTINEL RESOLVES IT
Customers find outages before you do	→	Uptime, response time and service health checked every 15 minutes, with email and SIGNL4 alerts the moment an app stops responding.
Errors hide in scattered logs	→	One combined read of every Supabase log source, grouped into a 24-hour error count, with personal details masked.
Database risks go unnoticed	→	Supabase security and performance advisories, backup age and Postgres upgrade notices explained by urgency, with links to official docs.
Security gaps ship with every release	→	Daily checks for exposed keys, .env files, source maps, weak security headers and content security policies, plus dependency vulnerabilities from your GitHub lockfile.
No idea which apps actually make money	→	Running costs per app and customer turned into cost per licence, break-even point and profit margin, month by month.
Growth arrives before capacity planning	→	A weekly capacity review with trends and Supabase upgrade recommendations, including what each upgrade would cost.
Customers left guessing during maintenance	→	Public status pages with incident and maintenance history, scheduled windows and calendar invites, and expected alerts paused while work is under way.

Is it live, secure, scalable and profitable?

See all four answers for every app in your portfolio within minutes of signing up.
